Lumberjacked - Changes From the One-Pager

CUT FROM THE ORIGINAL DESIGN

- Frenzy mode. No Frenzy meter and no chainsaw. Cut for time so I could focus on making the core chopping, logs and pinecones work without bugs.
- Beehive. Pinecones are the only falling hazard.
- Day / sunset / night backgrounds. There's one forest background the whole game.
- The woodblock beat that sped up with your chopping. There's no background audio at all now, so the M mute key wasn't needed either.
- Title screen. The game starts right away and the game over screen is a text overlay. Press R to restart.
- Mouse controls (clicking the left or right half of the screen) and Esc to pause.
- Wood chip particles. The golden log sparkle is drawn into the golden log sprite instead of being a particle effect.
- Some sounds: the "Timber!" shout, the low timer tick, chainsaw sounds, beehive buzz and menu clicks. The death sound plays for every kind of death and works as the game over sound.
- Pinecone art. The pinecone is still a placeholder brown diamond with a shadow under it.

CHANGED OR ADDED

- Pinecones always drop on the side the player is standing on, so you're forced to move. A pinecone only drops if the other side has no branch on the bottom two logs, so there's always a way to dodge. This was my fix for the "fair spawning" concern in the one-pager.
- Branch generation has two fairness rules: the log right after a branch never has a branch, and the first two logs never have branches so you don't die on your first chop.
- The timer doesn't start draining until your first chop.
- Knotted logs: the first hit cracks the log (it changes to a cracked sprite and plays a heavy thud), the second hit breaks it with the normal chop sound. Golden logs are worth 5 points and give an extra second on the timer.
- Difficulty goes up every 50 chops. The timer drains faster and pinecones drop more often, but both have limits so the game stays possible.
- Logs get reused instead of destroyed. When the bottom log is chopped it moves to the top of the tree with a new branch and type (the object pooling idea from the one-pager).
- Input buffering ended up not being needed since chopping happens instantly on the key press.
- The lumberjack flips to face the tree on either side, the axe shows a swing frame on each chop, and the lumberjack and axe turn red when you die.
- Controls: Left/Right arrows or A/D to chop, R to restart after a game over.
